The Signature Cycle

Type of Gains	Very high Quality Lean Mass, Fat Loss
Cycle Lenght (Excluding PCT)	109 Day's
Total Detention Time	260 Day's

Products Included	Qty	Weekly Dose
Cypocure	5 X 10 ml - 250mg/ml	857 mg
Primocure	10 X 10 ml - 100mg/ml	700 mg
Boldacure	3 X 10 ml - 250mg/ml	583 mg
Trenecure	3 X 10 ml - 200mg/ml	467 mg
Provicare	440 X 25 mg Tabs	
HCG	3 X 200iu Vial	
Nolvadex	60 X 20 mg Tabs	

Week / Date	Day	Cypocure	Primocure	Boldacure	Trenecure	Provicare	HCG	Nolvodex

Additional Notes

This is the signature cycle. This high premium cycle only uses products with the same half life to keep the cycle very simple. The gains made on this cycle will be of very high quality and this is deffinatly a cycle that could be used as a once in a lifetime cycle for those only wishing to complete one cycle, however it is not really recommended for the novice as it contains trenbolone which is not ideal for the steroid novice. The weekly doses for each product work out at: Testosterone Cypionate 875mg/week, Primobolan 700mg/week, Boldenone 583mg/week, Trenbolone Enanthate 467mg/week. Testosterone Cypionate (Cyopcore) is used as it has slightly less estrogenic effects and retains slightly less water than Testosterone Enanthate, some will argue propionate would be a better choice but Cypionate is used in this cycle to keep injection days simple and you will already have enough to inject on this cycle, so cypionate was the simpler choice to use as none of the other products retain water or aromatize. The Boldenone (Veboldex) will produce slow steady high quality gains that will remain after cycle. The Primobolan (Primocure) will produce the highest quality gains and also burn fat, the dose is high (not extreme) as dose needs to be over 500mg a week to get full benefits, both the boldenone and primobolan have little to zero side effects. The Trenbolone enanthate is what will produce the kick in the cycle, this will produce great gains in mass whilst burning fat to produce lean muscle. The Provironum will act as an anti estrogen for the testosterone (others products not a worry) and it will enhance all products and increases the amount of circulating free testosterone in your body, burn fat and produce a harder look. The HCG is used throughout cycle just to maintain testicular fuction, remember to store in refridgerator, 10mg (half a tb) of nolvadex is also taken same day as HCG simply to ensure no estrogen is produced, then both HCG and nolvadex are used for an aggressive PCT to restore full testicular function as quickly as possible. The products used in this cycle ensure zero estrogen, and you will achieve a very lean amount of mass that will be of very high quality and will remain once the cycle is complete.

Additional Notes

This cycle is a short budget cycle for users looking to add some extra mass over a short period of time, or for those those on a limited budget. This cycle is very common among the novice steroid users. The weekly dosage from this cycle works out at 583.3mg per week of Testosterone. At the start of cycle the very first dose is 500mg to help you reach consistant levels quicker, this also applies for the second Injection having a day shorter gap compared to the remainder of the cycle. Also injecting every 3 days rather than once every six days will help levels be more constant during the cycle, and this is needed as this is a short cycle, it will also mean smaller injections so any muscle can be used. If you would prefer less frequent injections for this cycle you could double the dose and inject every 6 days rather than every 3 days but injectioning every 3 days will be more beneficial. Please note should you experience sensitive nipples which is the first signs of gyno, take 1 nolvadex tablet a day until sensitivity returns to normal, however you must ensure you have enough nolvadex for PCT so if some is needed during the cycle, it is strongly advised you purchase additional nolvadex to replace what you have used.

Basic Mass Gain Cycle

Additional Notes

This cycle is your basic mass gain cycle, with weekly dose of 700mg of testosterone and daily dose of 60mg of Danacare. This cycle will produce great gains in strength and mass, and injections are only once every 5 days apart from start of cycle where the 2nd Injection is only 4 days after the first to help your body get more constant levels. Please note should you experience sensitive nipples which is the first signs of gyno, take 1 nolvadex tablet a day until sensitivity returns to normal, however you must ensure you have enough nolvadex for PCT so if some is needed during the cycle, it is strongly advised you purchase additional nolvadex to replace what you have used, ideally purchasing additional nolvadex at the time of purchasing this cycle is a very wise decision.

	101			20 mg	

Additional Notes

This cycle is an ideal great value starter cycle for the steroid novice. The weekly dosage of each product works out at 437.5mg per week which is an ideal starting dose for a very first cycle for both products. The testosterone (Testacure) is the base of the cycle and the Boldenone (Boldacure) will produce good quality gains that will remain once cycle is finished, also equipoise does not retain water or aromatise, and has little to zero side effects. At the start of cycle the very first dose is 500mg of each product to help you reach consistant levels quicker, this also applies for the second injection having a day shorter gap compared to the remainder of the cycle. Also injecting every 4 days rather than once a week will help levels be more constant during the cycle. You can mix both products together in syringe for a single injection. There are also other good value oral products you could add to this cycle for additional effects. Adding a product like Danabol DS will produce more mass and strength, or adding Stanozolol (Strombear, Stanzol, Stanztabs, Azolol) will produce some more definition and extra strength gains.

Shrek Mass Cycle

Type of Gains	Very high Quality Lean Mass, Fat Loss
Cycle Lenght (Excluding PCT)	102 Day's
Total Detention Time	630 Day's

Products Included	Qty	Weekly Dose
Testacure	6 X 10 ml - 250mg/ml	1167 mg
Boldacure	2 X 10 ml - 250mg/ml	583 mg
Decacure	2 X 10 ml - 250mg/ml	467 mg
Trenecure	2 X 10 ml - 200mg/ml	467 mg
Oxycare	100 X 50 mg Tabs	
Provicare	200 X 25 mg Tabs	
HCG	3 X 5000iu Vial	
Nolvadex	60 X 20 mg Tabs

Additional Notes

This cycle will produce quality mass gains, the Testacure was used in this cycle as it has the same the as other products used, the Boldacure and Decacure will slowly. produce quality gains in mess, the Trenecure will produce lean gains and tum fat, the cycle is kick started with Oxycare which will produce great gains in mass and strength, the provicare is aded to enhance all other products and increase free testosterone in your body and also work as an anti estrogen. All products can be mixed in the came syringe, if mixing all then the glutes would be anyl ideal injection spot to use.

Ripped Short Cutting Cycle

Type of Gains	Lean Mass, Strenght, Fat Loss
Cycle Lenght (Excluding PCT)	61 Day's
Total Detention Time	210 Day's

Products Included	Qty	Weekly Dose
Propacure	3 X 10 ml - 100mg/ml	525 mg
Mastacure	3 X 10 ml - 100mg/ml	350 mg
Trenacure	3 X 10 ml - 100mg/ml	350 mg

	81							20 mg

Additional Notes

This cycle will produce very lean gains with great definition and fat loss and also some good strength gains, All products used are cutting products so do not expect huge gains in mass, but all gains will be very lean. You will retain little water on this cycle so fish oil supplements are highly recommended, you could also extend the length of this cycle if extra products are purchased. There should be zero estrogenic side effects from this cycle. All Injectable products can be mixed in same syringe for a single injection. This cycle is ideal for anyone looking to gain more definition and extra strength without extra mass, although not recommended for the athlete as detection time is quite long, However the Injection period could be reduced by a month if the user was to replace the Trenacure, the dose would be lower 100mg becomes 75mg but the detection period is a lot shorter, if it is desired to replace the Tren acetate (Trenacure) with Tren mex' simply add the request in the customer comments box during checkout, this would then give the cycle a total detection period of 120 days.

Athletics Short 55 Day Cycle

Type of Gains	Mass
Cycle Lenght (Excluding PCT)	41 Day's
Total Detention Time	55 Day's

Products Included	Qty
Propacure	4 X 10 ml - 150mg/ml
Rexacare	100 X 10 mg Tabs
Oxanacare	200 X 20 mg Tabs
Nolvadex	30 X 20 mg Tabs

Additional Notes

This cycle is a cycle aimed to produce strength gains and burn fat without adding extra mass while also keeping a low detection period. The Oxanacare and Rexacare are used to provide extra gains in strength and to burn fat without adding extra mass gains. All products used are chose for their short detection times and they will not be detectable from day 56.

Athletics 75 Day Cycle

Type of Gains	Explosive Strenght
Cycle Lenght (Excluding PCT)	61 Day's
Total Detention Time	75 Day's

Products Included	Qty	Weekly Dose

	81						20 mg

Additional Notes

This cycle is a cycle aimed to produce explosive strength gains without adding extra mass while also keeping a low detection period. The Mastacure and Halocare used at very start of the cycle with provide quick boosts in explosive strength, the user may find aggression a common side effect during the first 2 weeks of the cycle, this will pass in the following weeks. The aggression is caused by the Halocare to increase gains in strength through extra aggression during workouts. The Oxanacare and Rexacare are used to provide extra gains in strength and to burn fat without adding extra mass gains. All products used are choosed for their short detection times and they will not be detectable from day 76.

Rugby Off Season Back Cycle

Type of Gains	Explosive Strenght
Cycle Lenght (Excluding PCT)	82 Day's
Total Detention Time	95 Day's

Products Included	Qty	Weekly Dose
Propacure	3 X 10 ml - 100mg/ml	700 mg
Primocure	6 X 10 ml - 100mg/ml	525 mg
Rexacare	300 X 10 mg Tabs	
Oxanacare	300 X 10 mg Tabs	
Halocare	30 X 20 mg Tabs	
Nolvadex	30 X 20 mg Tabs	

Gray block indicates Detention Time

Additional Notes

This cycle is specifically designed for Rugby Off season and tailored for backs or players looking to gain extra lean quality muscle and explosive strength from a single cycle without gaining too much extra bulk mass. This cycle also tries to cram as much as possible into the one cycle when only one cycle a year will be possible. The red on the table indicates the products detection period, so on day 96 your body will be clear of detectable products. The Testosterone dose is 700mg per week and is testosterone propionate which is fast acting and has the shortest detection time. The Primocure dose is 700mg per week except for first few weeks which is slightly lower, this is simply due to cost and other faster acting products will be working at that time. Primocure needs to be run at high dose above 500mg/week to fully benefit from it, the Primocure is injected every 4 days, it is not advised to mix with propionate, it is advised to inject the Primocure into Glutes alternatively as 4ml is a large enough injection, the 1ml propionate injection can then be rotated between smaller muscles. The Rexacare will add lean muscle and extra strength and will not retain water, the oral Stanozolol is used as it has a much shorter detection time compared to the injectable version. The remaining Oxanacare and Halo are added simply as strength gainers, the Halo is the stronger but has a longer detection period so only used at start of the cycle, it would be best to take 1 hour prior to workout, this will add extra aggression which is utilized during workouts and will also provide explosive strength gains. The Oxanacare has a shorter detection time so can be used for longer, you could also increase the dose a bit more if desired, but it is expensive. Milk thistle is also strongly advised to be used with this cycle at a dose of 140-280mg per day. The only product that may produce side effects is the halo which will cause aggression, All products used in this cycle will not retain water or aromatize.

Rugby Off Season Forward Cycle

Type of Gains	Lean Mass, Strenght
Cycle Lenght (Excluding PCT)	82 Day's
Total Detention Time	95 Day's

Products Included	Qty	Weekly Dose
Propacure	3 X 10 ml - 100mg/ml	525 mg

Additional Notes

This cycle is specifically designed for Rugby Off season and tailored for forwards or players looking to gain as much mass and strength possible from a single cycle with short detection time after. This cycle also tries to cram as much as possible into the one cycle when only one cycle a year will be possible. The red on the table indicates the products detection period, so on day 96 your body will be clear of detectable products. The Testosterone dose is 700mg per week and is testosterone propionate which is fast acting and has the shortest detection time. The Trenbolone Hex is the only Trenbolone suitable for this cycle as Trenbolone Hex has a detection time of 5 weeks compared to Trenbolone Acetate or Trenbolone Enanthate which both have detections times of upto 5 months. the Hexacure could also be injected less frequently but to keep the cycle simple it can be injected with the propionate, there are 2 benefits, the injection will be smaller (but more frequent) so you have a wider choice of muscles you can inject, also it can be mixed with the propionate in the same syringe for a single 2ml injection every other day. The Danacare will simply add mass, Danacare is used over Oxymetholone (naps) as Danacare can be run for longer as opposed to Oxymetholone which has a longer detection period, and as this is an off season cycle the Danacare doses are slightly above average (not extreme), additional nolvadex has been added incase any signs of gyno develop. The Provicare has been added to cycle to also act as an anti estrogen whilst Danacare is being used, it will also enhance all other products especially the testosterone. The remaining Oxanacare and Halo are added simply as strength gainers, the Halo is the stronger but has a longer detection period so only used at start of the cycle, it would be best to take 1 hour prior to workout, this will add extra aggression which is utilized during workouts. The Oxanacare has a shorter detection time so can be used for longer, you could also increase the dose a bit more if desired, but it is expensive. Milk thistle is also Strongly advised to be used with this cycle during the first 60 days at dose of 140-280mg per day.

MMA Strength Cycle

Additional Notes

This cycle is specifically designed for Rugby Off season and tailored for forwards or players looking to gain as much mass and strength possible from a single cycle with short detection time after. This cycle also tries to cram as much as possible into the one cycle when only one cycle a year will be possible. The red on the table indicates the products detection period, so on day 96 your body will be clear of detectable products. The Testosterone dose is 700mg per week and is testosterone propionate which is fast acting and has the shortest detection time. The Trenbolone Hex is the only Trenbolone suitable for this cycle as Trenbolone Hex has a detection time of 5 weeks compared to Trenbolone Acetate or Trenbolone Enanthate which both have detections times of upto 5 months. the Hexacure could also be injected less frequently but to keep the cycle simple it can be injected with the propionate, there are 2 benefits, the injection will be smaller (but more frequent) so you have a wider choice of muscles you can inject, also it can be mixed with the propionate in the same syringe for a single 2ml injection every other day. The Danacare will simply add mass, Danacare is used over Oxymetholone (naps) as Danacare can be run for longer as opposed to Oxymetholone which has a longer detection period, and as this is an off season cycle the Danacare doses are slightly above average (not extreme), additional nolvadex has been added incase any signs of gyno develop. The Provicare has been added to cycle to also act as an anti estrogen whilst Danacare is being used, it will also enhance all other products especially the testosterone. The remaining Oxanacare and Halo are added simply as strength gainers, the Halo is the stronger but has a longer detection period so only used at start of the cycle, it would be best to take 1 hour prior to workout, this will add extra aggression which is utilized during workouts. The Danacare has a shorter detection time so can be used for longer, you could also increase the dose a bit more if desired, but it is expensive. Milk thistle is also Strongly advised to be used with this cycle during the first 60 days at dose of 140-280mg per day.
